MRI of Lumbo-Sacral Spine

Imaging protocol: Multiple imaging sequences were realized in different planes.

Clinical information: Wasting of muscle of both lower limbs for 4-5 years.

Findings:

Lumbar lordosis is slightly straightened with normal vertebral alignment.
All lumbo-sacral discs are normally hydrated.
The vertebral bodies are normal in their number, shape and interrelationships. The articulating vertebral end plates present smooth margins. The intervertebral disk spaces are of normal height and the disks do not project beyond the posterior surface of the vertebral bodies in any segment.
The spinal cord displays normal course, configuration width and internal structure.
The prevertebral and paravertebral soft tissue show no abnormalities.

Impression:

Straightening of lumbar lordosis (lumbar muscle spasm), otherwise no definite abnormality detected.
