

PATIENT: Safwan
AGE: 1y 6mo
SEX: M
OFC: 43cm
D : D 55288
E-NO: 43021
REC. DATE: 01.06.24
BIRTH DATE: 03.12.22

REFERRED BY : Prof. Dr. Gopen Kumar Kundu

CLINICAL SUMMARY: ?Epilepsy with GDD and Low Vision

CURRENT TREATMENT: PB

PATIENT'S STATE DURING RECORDING: The child was sleeping at early part of the recording. Later awake.

EEG REPORT

DESCRIPTION: Irregular 3-5 c/s 100-150 μ v activity is seen over both the hemispheres mixed with other activities during sleep. Vertex sharp transients, k-complex and sleep spindles are seen over fronto-central region during early stage of sleep. Irregular 5-6 c/s 20-40 μ v activity is seen over both the hemispheres on awakening. On eye closure no rhythmic reactivity is observed over posterior region. **Photoc stimulation** elicits no following effects over occipital region. No spike or sharp wave is seen.

COMMENT: This record in sleep and awake state shows activities normal for age and state of the child. No epileptiform discharge is seen during recording.

However, please co-relate clinically and with other investigation results.
